The debate over whether or not our universe was designed with a purpose is one that centers not around philosophical questions but over "competing scientific explanations of the data". That is the central argument expounded by Phillip Johnson in Intelligent Design 101, a book that aims to bring into sharp focus the central tenets of the intelligent design (ID) movement. Contrary to a popular misconception, the modern day controversy over design in biology is not one that arose from some push to force Judeo-Christian beliefs into the science classroom. It is instead one that extends back thousands of years to the time of Plato and Xenophon in ancient Greece. Today the educational literature defines all aspects of biology in purely naturalistic terms. What is more, evolution has become the "monolithic fact" that we must all embrace. Even though there is incontrovertible evidence that defies such a factual status, evolutionists have bent over backwards to make naturalism fill in the glaring inconsistencies in the data. As a vociferous opponent of the macro-evolutionary aspects of Darwinism, Johnson has attempted a "divide and conquer" approach to break such a stronghold. By separating philosophical naturalists such as Richard Dawkins from scientists with a sound objective outlook, Johnson's much-publicized Wedge Strategy has sought to

prize neo-Darwinism away from its "pedestal of philosophical naturalism". Attacks on Johnson's initiative have focused on the religious backgrounds of its supporters rather than on the sound scientific arguments that they put forward. Still, as Johnson remarks those who today maintain that ID is all about religion ignore the counter claim that the theory of evolution is not exactly all about science.
